The vectors allow and extension of the encapsidation and eliminate risks of cell-type specific gene expression and eliminate risks of downstream activation of cellular proto-oncogenes.

PR Recombinant vaccine against fowlpox virus is free of contamination procure of chickens are combinant fowlpox virus (FPV) whose nucleic from reticuloendotheliosis virus, used to prevent the virus procured in chickens are recombinant fowlpox virus (FPV), and occurrence in relates to a recombinant fowlpox virus (FPV), and procure of solution and the incidence. The vaccine is used to produce an active reticuloendotheliosis virus (FPV), and cald does not encode an active reticuloendotheliosis virus (FPV), and those genome does not contain any REV sequence. The vaccine is used to produce a vaccine against fowlpox virus in chickens. The vaccine is used to prevent the occurrence of fowlpox virus in chickens. The vaccine than 1 day of age. Alternatively, chickens can be considered to produce at older than 1 day of age. Alternatively, chickens carry a vaccinated with the vaccine subsequent to vaccine and field strains of any can be prior vaccine and field strains carry a vaccinated be vaccinated with the vaccine strate to infectious REV and (FPV MI) length provirus of REV, and can give rise to infected. The combination provides the means by which a FPV vaccine free from the provice of the provice active free from the number of the provice active present invention provides the means by which a FPV nucleic active present invention by REV may be produced. Sequences x26110-115 represent FPV contamination by REV may be produced. Sequences x26110-115 represent FPV may be produced. Sequence selected from the above.

CC contamination of the FPV may be p

Example 4; Fig 5; 127pp; English.

The invention relates to a recombinant fowlpox virus (FPV) whose nucleic reacid does not encode an active reticuloendotheliosis virus (REV), and cald does not encode an active reticuloendotheliosis virus (REV), and cald does not encode any REV sequence. The recombinant FPV is recided to produce a vaccine against fowlpox virus. The vaccine is used to used to produce a vaccine against fowlpox virus in chickens. The chickens can be compared than 1 day of age. Alternatively, chickens older than compared at older than 1 day of age. Alternatively, chickens older than compared than 1 day of age. Prior vaccine and field strains of the vaccine and field strains of the representation with the vaccine of the representations of the representations. The representation provides the means by which a FPV vaccine free from transfected into cell cultures and when chickens are infected. The present invention provides the means by which a FPV vaccine free from the present invention provides the means by which a FPV vaccine free from the present invention provides the means by which a FPV vaccine free from the present invention provides the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the means by which a FPV vaccine free from the province of the province of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13

PT Polyvected SC, Choi GH, Dillon FL,

PT Polyvected on computer readable medium and used in the production of anti-S.aureus vaccines medium and used in the production of the invention. The DNA sequences of Stabnylococcus aureus of the invention. The DNA sequences are recorded on a computer readable commonly (RNA), read-only memory (RNA), or CD-RNA. Homology searches using the used in a vaccine composition sputative functions to be assigned so pypeptides can also be used in a vaccine composition spatial st. Specifically, required so pypeptides can also be used in a sample. S.aureus is implicated and these polypeptides can expical wound infections, scalafed of kind these polypeptides can expical wound infections, scalafed skin sinfection in the composition of the polypeptides. The new DNA sequences of any of the S.aureus DNA sequences can be used in the Saureus DNA seque RESULT 11

PT Expression promoter for genes inserted into plant seeds heat-resistant beta-amylase gene inserted into barley seeds

Example 6; Page 20-21; 33pp; Japanese.

CC from a barley beta-amylase (EC 3.2.1.2) gene and other sequences used for integration of this promoter into a reporter plasmid. The seed for the production of transgenic barley plants

Such plants and seeds have improved maturation properties

Expression promoter for genes inserted into place plant of the promoter defineration promoter is used for the claim 5; Page 17-18; 33pp; Japanese.
762570 is a heat resistant promoter derived from transgenic barley plants and seeds. Such plant; improved maturation properties.

growth hormone sequence is part of
DNA which is especially useful for
of tissue plasminogen-activator.

It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping sequencing collaboration between the NHGRI Chromosome 7 Mapping sequencing certor), John D. McPherson in the Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send

The library is from one male donor.

The clone may be obtained either from Genome Systems, Inc. (http://www.genomesystems.com) or Research Genetics, Inc. (http://www.resgen.com); or from Pieter de Jong.

VECTOR: pCYPAC2

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP5-1161G23, 200 bp overlap. Actual start of this clone is at base position 83123 of RP5-1161G23; actual end is at 70480 of RP5-909F12.

Sequence 1, Application US/08793599; Patent No. 5952489; GENERAL INFORMATION:
APPLICANT: OKADA, YUKIO
APPLICANT: YOSHIGI, NAOHIRO
APPLICANT: ITO, KAZUTOSHI
APPLICANT: KIHARA, MAKOTO
TITLE OF INVENTION: TISSUE-SPECIFIC PROMOTER
FILE REFERENCE: 2589-0056-0 PCT
CURRENT APPLICATION NUMBER: US/08/793,599
CURRENT FILING DATE: 1997-03-04
EARLIER APPLICATION NUMBER: PCT/JP96/01866
EARLIER APPLICATION NUMBER: JP 191028/1995
EARLIER FILING DATE: 1996-07-05
NUMBER OF SEQ ID NOS: 3
NUMBER OF SEQ ID NOS: 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g

MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN Release #1.0, VE
APPLICATION NUMBER: US/08/077,848A
FILING DATE: 16-JUN-1993
CLASSIFICATION: 424
ATTORNEY/AGENT INFORMATION:
NAME: Haile, Ph.D., Lisa A.
REGISTRATION NUMBER: 38,347
REFERENCE/DOCKET NUMBER: PD-2845
TELECOMMUNICATION INFORMATION:
TELEPHONE: (619) 455-5100
INFORMATION FOR SEQ ID NO: 1:
SEQUENCE CHARACTERISTICS:
LENGTH: 3946 base pairs
TYPE: nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

T Recombinant retrovirus vector, contg. non-retroviral gene, - has ability to produce progeny virus, in helper cell which can infect thost cell and form provirus

S Example; Page 17; 28pp; English.

C The universal retroviral vector pPO115-R1 (given in Q76041) was cotained by replacing the SV40 promoter and hpt gene of pPO111-R1 (Q76038) with the multiple cloning site of pBluescript II KS. The vectors allow cell-type specific gene expression and eliminate risks of downstream activation of cellular proto-oncogenes.

Example; Page 13-14; 28pp; English.

Example; Page 13-14; 28pp; English.

New recombination-free, highly efficient retroviral vectors ppoll1-R1 (given in Q76038), ppoll1-R2 (Q76039) and ppoll1-R3 (Q76040) were obtained by replacing the U3 region of the left (Q76040) were obtained by replacing the U3 region of the left and extension of the encapsidation region. The vectors allow cell-type specific gene expression and eliminate risks of downstream activation of cellular proto-oncogenes.

T62570 is a heat resistant promoter derived from (EC 3.2.1.2) gene. The promoter is used for the ptransgenic barley plants and seeds. Such plants a improved maturation properties.

New isolated hur
useful for diagr
disorders, immur
Claim 1; Page 2;
This sequence re
human protein. I
can be used to g
New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders Claim 1; Page 236-237; 312pp; English.

This sequence represents a nucleic acid molecule which encodes a secreted can be used to generate fusion proteins by linking to the gene to a human the fused protein as compared to the human protein only.

The invention relates to 83 novel genes and their fragments (nucleic acid sequences: X20412-X20499; amino acid sequences y00258-y00377) which are useful for preventing, treating or ameliorating medical conditions

Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 86 polynucleotides, based or specific uses they are most highly expressed in (see X20412 for describe uses).

Bovine and mouse Sry-related DNA - useful for det
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of unborn animals
Claim 1; Page 10-14; 21pp; Japanese.
This is the nucleotide sequence of a gene encoding a mouse SRY-related This is the nucleotide sequence of a gene encoding a mouse SRY-related This is the nucleotide sequence of a gene encoding a mouse SRY-related This is the nucleotide sequence of a gene encoding a mouse SRY-related The screen con a mouse genomic library using a protein. The gene was isolated from a mouse genemic library using a protein tamplified by primers T33009-10 as a protein the gene.

1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene.
1501ated 4 Ecori fragments of 2.3, 2.8, 3.5 and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Q54222 stand
